# Dataset Prestige

We will be using a well-known dataset called **Prestige** from the **car** R package. This dataset deals with prestige ratings of Canadian Occupations. The **Prestige** dataset has 102 rows and 6 columns. The observations are occupations.

This data frame contains the following columns:

- **education** - Average education of occupational incumbents, years, in 1971.
- **income** - Average income of incumbents, dollars, in 1971.
- **women** - Percentage of incumbents who are women.
- **prestige** - Pineo-Porter prestige score for occupation, from a social survey conducted in the mid-1960s.
- **census** - Canadian Census occupational code.
- **type** - Type of occupation. A factor with levels: bc, Blue Collar; prof, Professional, Managerial, and Technical; wc, White Collar. (includes four missing values).

Load the data:

```
library(car)
data(Prestige)
```

## Exercise 2.1

Draw a bar chart for **type**:

```
library(tidyverse)

p <- Prestige |>
  ggplot() +
  aes(type) +
  geom_bar()

p
```

Or with **plotly** (which works for HTML, not for PDF)

```
library(plotly)

ggplotly(p)
```

Or with old-style R plot

```
# or  
library(car)  
barplot(table(Prestige$type))
```

## Exercise 2.2

Draw a histogram of **prestige**.

Below demonstrates the flexibility of **ggplot** code. You can specify the **data** argument by piping it into **ggplot**, or by putting it as an argument to **ggplot** or a **geom\_**. Likewise, the **aes** information, which determines which variables are used where, can be added as an extra line or specified inside the **ggplot** or **geom\_** function.

```
Prestige |>
  ggplot() +
  aes(x = prestige) +
  geom_histogram(bins=10)

ggplot(Prestige) +
  aes(x = prestige) +
  geom_histogram(bins=10)

ggplot() +
  geom_histogram(
    data = Prestige,
    mapping = aes(x = prestige),
    bins = 10
  )

# or
# library(plotly)
# p <- Prestige |>
#   ggplot() +
#   aes(prestige) +
#   geom_histogram(bins=10)
#
# ggplotly(p)

# or
```

```
# hist(Prestige$prestige)
```

```
Prestige |>  
  ggplot() +  
  aes(x = rownames(Prestige), y = prestige) +  
  geom_point() +  
  coord_flip()
```

What a mess!

We can tidy it up by ordering the professions according to prestige. First, we move the professions from rownames to a variable. Then, we `fct_reorder` the professions using `prestige`.

```
Prestige |>
  rownames_to_column(var = "profession") |>
  mutate(profession = fct_reorder(profession, prestige)) |>
  ggplot() +
  aes(x = profession, y = prestige, col = type) +
  geom_point() +
  coord_flip()
```

## Exercise 2.3

Obtain the summary statistics for **prestige**:

```
summary(Prestige)

library(psych)

describe(Prestige)

describeBy(education + income + women + prestige ~ type,
           data = Prestige)
```

## Exercise 2.4

Obtain the boxplot of `prestige ~ type`:

```
Prestige |>
  ggplot() +
  aes(y=prestige, x=type) +
  geom_boxplot()

# or
# library(plotly)
# p <- Prestige |> ggplot() +
#   aes(y=prestige, x=type) + geom_boxplot()
# ggplotly(p)

# or
# library(lattice)
# bwplot(prestige ~ type, data=Prestige)

# as violin plots
Prestige |>
  ggplot() +
  aes(y=prestige, x=type) +
  geom_violin()

# Or put it all together
Prestige |>
  ggplot() +
  aes(y=prestige, x=type) +
  geom_violin() +
  geom_boxplot(col = 2, alpha = .2) +
  geom_jitter(alpha = .2, width = .2, height = 0, colour = 4)
```

## Exercise 2.5

Obtain the Empirical Cumulative Distribution Function (ECDF) graphs of **prestige ~ type**:

```
Prestige |>
  ggplot() +
  aes(prestige, colour=type) +
  stat_ecdf()
```

```
Prestige |>
  ggplot() +
  aes(prestige) +
  stat_ecdf() +
  facet_wrap(~type)
```

```
# or
library(latticeExtra)
ecdfplot(~ prestige | type, data = Prestige)
```

```
Prestige |>
  ggplot() +
  aes(
    x = prestige, # these aes settings are used
    col = type    # by both geoms
  ) +
  geom_density(
    aes(fill = type), # the 'fill' aes goes here because
    alpha = .2        # geom_rug doesn't use 'fill'
  ) +
  geom_rug()
```

## Exercise 2.6

Obtain the  $\{0.05, 0.1, 0.25, 0.5, 0.75, 0.9, 0.95\}$  quantiles of `prestige`:

```
pr <- c(0.01, 0.05, 0.1, 0.25, 0.5, 0.75, 0.9, 0.95, 0.99)

Prestige |>
  summarise(
    probs = pr,
    quants = quantile(prestige, pr)
  )

# or simply
quantile(Prestige$prestige, pr)
```

## Exercise 2.7

Obtain the scatter plot (with and without marginal boxplots) **prestige vs. education** :

```
library(ggExtra)

p1 <- Prestige |>
  ggplot() +
  aes(x=education, y=prestige) +
  geom_point() +
  geom_smooth(col = 2) +
  geom_smooth(method = "lm", se = FALSE)

ggMarginal(p1, type="boxplot")

library(car)

scatterplot(education ~ prestige, data = Prestige)
```

The later plot will show prediction interval ribbon while the first plot will show the confidence interval ribbon.

## Exercise 2.8

Obtain the bubble or balloon plot **prestige vs. education vs. income** (income forming the bubble size):

```
library(ggplot2)

Prestige |>
  ggplot() +
  aes(x = education, y = prestige, size = income) +
  geom_point()

# or

library(plotly)

p <- Prestige |>
  ggplot() +
  aes(x = education, y = prestige, size = income) +
  geom_point()

ggplotly(p)
```

## Exercise 2.9

Obtain the contour plot **prestige vs. education vs. income** :

```
library(plotly)

plot_ly(type = 'contour',
        x = Prestige$education,
        y = Prestige$income,
        z = Prestige$prestige)
```

To add axes labels and titles, try-

```
library(plotly)

plot_ly(
  Prestige,
  type = 'contour',
  x = Prestige$education,
  y = Prestige$income,
  z = Prestige$prestige
) |> layout(
  title = 'Contour Plot of prestige scores',
  xaxis = list(title = 'education'),
  yaxis = list(title = 'income')
)
```

We can also define our own function for the contour approximation.

```
library(modelr)

# make a smooth model
y.m = loess(prestige ~ education * income, data = Prestige)

# make a regular grid of all combinations of education and income
mygrid <- Prestige |>
  data_grid(
    education = seq_range(education, 50),
    income = seq_range(income, 50)
  ) |>
  # add predicted prestige using the smooth model
  add_predictions(y.m, var = "predicted prestige")

# make ggplot contour plot
p <- mygrid |>
  ggplot() +
  aes(x = education, y = income, z = `predicted prestige`) +
  geom_contour()

p

# make a plotly version
library(plotly)
ggplotly(p)
```

```

# filled contour ggplot
mygrid |>
  ggplot() +
  aes(x=education, y=income, z=`predicted prestige`) +
  stat_contour_filled()

# or the older-style lattice graphs

library(lattice)

contourplot(`predicted prestige` ~ education * income,
            data = mygrid,
            cuts = 10, region = TRUE,
            xlab = "education ", ylab = "income ")

wireframe(`predicted prestige` ~ education * income,
          data = mygrid,
          cuts = 10, region = TRUE,
          xlab = "education ", ylab = "income ")

levelplot(`predicted prestige` ~ education * income,
          data = mygrid,
          cuts = 10, region = TRUE,
          xlab = "education ", ylab = "income ")

cloud(`predicted prestige` ~ income * education,
      data = mygrid)

```

## Exercise 2.10

Obtain the 3-D plot **prestige vs. education vs. income** :

```
library(car)

scatter3d(prestige ~ education + income,
          data = Prestige)
```

## Exercise 2.11

Create `prestige ~ education | type` graphs. That is, `prestige ~ education` grouped by `type` as colours and/or panels.

```
Prestige |>
  ggplot() +
  aes(x = education, y = prestige, color = type) +
  geom_point() +
  facet_wrap(~ type)

# or
# library(plotly)
#
# p <- Prestige |>
#   ggplot() +
#   aes(x = education, y = prestige, color = type) +
#   geom_point() +
#   facet_wrap(~ type)
#
# ggplotly(p)

p <- Prestige |>
  ggplot() +
  aes(x = education, y = prestige, color = type) +
  geom_point()

p

# OR
#
# library(plotly)
# ggplotly(p)
```

```
scatterplot(prestige ~ education | type,  
            data=Prestige)
```

```
xyplot(prestige ~ education | type,  
        auto.key = TRUE,  
        data = Prestige)
```

```
xyplot(prestige ~ education,  
        group = type,  
        auto.key = TRUE,  
        data = Prestige)
```

## Exercise 2.12

Time-series data EDA based on RBNZ house sales data.

```
url1 <- "https://www.massey.ac.nz/~anhsmith/data/housesales.RData"  
download.file(url = url1, destfile = "housesales.RData")  
load("housesales.RData")
```

```
library(forecast)  
autoplot(housesales)
```

```
# Dynamic graphing  
# https://rstudio.github.io/dygraphs/index.html
```

```
library(dygraphs)
```

```
dygraph(housesales) |>  
  dyOptions(drawPoints = TRUE)
```

```
dygraph(housesales) |>  
  dyOptions(fillGraph=TRUE)
```

```
ggseasonplot(housesales)
```

```
ggsubseriesplot(housesales)
```

### Series Decomposition

```
library(tidyverse)
```

```
housesales |>  
  decompose(type="additive") |>  
  forecast::autoplot() +  
  ggtitle("")
```

```
housesales |>  
  decompose(type="multiplicative") |>  
  forecast::autoplot() +  
  ggtitle("")
```

### lag & ACF plots

```
gglagplot(housesales)
```

```
gglagplot(housesales, seasonal=FALSE, lag=1)
```

```
ggAcf(housesales)
```

```
ggPacf(housesales)
```

```
ggtsdisplay(housesales)
```

More graphing examples are [here](#) (R codes file).
